Airitle: Nucleotide sequence of the genome of Pf3, an IncP-1 plasmid-specific filament
Airitle: Nucleotide sequence of the genome of Pf3, an IncP-1 plasmid-specific filament
Airitle: Nucleotide sequence of the genome of Pf3, an IncP-1 plasmid-specific filament
Airitle: Nucleotide sequence of the genome of Pf3, an IncP-1 plasmid-specific filament
Airitle: Nucleotide sequence of the genome of Pf3, an IncP-1 plasmid-specific filament
Airitle: Nucleotide sequence of the genome of Pf3, and IncP-1 plasmid-specific filament
Airitle: Nucleotide sequence of the genome of Pf3, and IncP-1 plasmid-specific filament
Airitle: Nucleotide sequence of the genome of Pf3, and IncP-1 plasmid-specific filament
Airitle: Nucleotide sequence of Pf3, and IncP-1 plasmid-specific filament
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               10;

A) Nature 392, 353-358, 1998

A) The complete genome of the hyperthermophilic bacterium Aquifex aeolicus.

A) Reference number: A70300, MUID: 98196666; PMID: 9537320

A) Accession: E70411

A) Status: preliminary; nucleic acid sequence not shown; translation not shown

A) Residues: 1-625 < AQF>

A) Cross-references: GB. AE000732; NID: 92983704; PIDN: AAC07271.1; PID: 92983708; GB: AE00065

C) Generics:

A) Gene: 98PD

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                            A Geneseq 19Jun03:*

                                                                                                                                                                                                                                                                                                                                                         9
                                                                                                                The present sequence represents a Neisseria meningitidis antigenic polypeptide, designated BASB030. It was identified from N meningitidis serotype B strain ATCC 13090. The nucleotide sequence was first thiddentified in the Incyte Pathoseq database of unfinished genomic DNA sequences of this strain. The polypeptides or polynucleotides can be used in vaccine compositions for preventing N. meningitidis infections, be used for treating N. meningitidis against the product can be used for treating N. meningitidis disease. The products can also be used for diagnosis of disease, staging of disease or response of an infectious organism to drugs, as well as for drug screening.

It was identified from N. meningitidis serotype B strain H44/T6. The nucleotide sequence was first identified in the Incyte Pathoseq database of unfinished genomic DNA sequences of this strain. The polypeptides or polynucleotides can be used in vaccine compositions for preventing N. meningitidis infections, e.g. bacterenia and meningities. The antibodies against the protein can be used for treating N. meningitidis disease. The products can also be used for diagnosis of disease, staging of disease or response of an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  οŧ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a Neisseria meningitidis antigenic polypeptide, designated BASB030. It was identified from N. meningitidis serotype B strain ATCC 13090. The nucleotide sequence was first identified in the Incyte Pathoseq database of unfinished genomic DNA sequences of this strain. The polypeptides or polynucleotides can be used in vaccine compositions for preventing N. meningitids infections, e.g. bacteremia and meningities. The antibodies against the protein can be used for treating N. meningitidis disease. The products can also be used for diagnosis of disease, staging of disease or response of an infectious organism to drugs, as well as for drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            of

The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and antibodoies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABB81046 represent nucleic acid molecules of the invention.
                                                                                                                                                                                                                                                   380 GKMTLSLKDVPWDQALDLVMQARNLDMRQQGNIVNIAPRDELLAKDKAFLQAEKDIADLG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is the BASBO11 protein sequence-1, from strain Mc2931(ATCC 43617), derived from Moraxella catarrhalis. This polypeptide sequence has homology to Pseudomonas aeruginosa, PilQ fimbrial assembly protein. This sequence can be used for prevention and treatment of M.catarrhalis infections, like otitis media, pneumonia, sinusitis and nosocomial infections. The antibodies and polymucleotide sequence can be used for diagnosing infections saging of diseases and for determining the response of an infections organism to drugs. The DNA sequence is also used as a hybridisation probe in screening process for identifying
                                                                                                                                                                                                              1 MNTKLTKIISGLFVATAAPQTASAGNITDIKVSSLPNKQKIVKVSFDKEIVNPTGFVTSS 60
                             The present invention relates to a new gram-negative bacterial bleb presenting on its surface the PorB outer membrane protein from Chlamydia trachomatis, or a protective antigen from C. pneumoniae. The invention is useful for preventing C. trachomatis or C. pneumoniae infection in a host. The present amino acid sequence represents a Neisseria gonorrhoeae protein as described in the invention.
                                                                                                                                                                                                                              1 MNTKLTKIISGLFVATAAFQTASAGNITDIKVSSLFNKQKIVKVSFDKEIVNPTGFVTSS 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is the BASBO11 protein sequence-2, from strain dec2911(ATCC 43617), derived from Moraxella catarrhalis. This polypeptide sequence has homology to Pseudomonas aeruginosa, PilQ fimbrial assembly protein. This sequence can be used for prevention and treatment of Moratarrhalis infections, like officis media, pneumonia, sinusitis and nosocomial infections. The antibodies and polynucleotide sequence can be used for diagnosing infections, staging of disease and for determining the response of an infectious organism to drugs. The DNA sequence is also used as a hybridisation probe in screening process for identifying homologue and orthologs from other species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  BASB031; strain Mc2931; ATCC 43617; PilO fimbrial assembly protein; diagnosis; treatment; otitis media; sinusitis; pneumonia; screening; homology; nosocomial infection; antibody; ortholog; hybridisation probe.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is the BASB031 polypeptide, from strain Mc2911, derived from Moraxella catarrhalis. This sequence has homology to Pseudomonas aeruginosa, PilQ fimbrial assembly protein. This sequence can be used for prevention and treatment of M.catarrhalis infections, like ctitis media, pneumonia, sinusitis and nosocomial infections, infections, antibodies and polynucleotide sequence can be used for diagnosing infections staging of disease and for determining the response of an infectious organism to drugs. The DNA sequence is also used as a hybridisation probe in screening process for identifying homologue and orthologs from other species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel polypeptides used as vaccines for treating Maraxella catarrhalis
infections like otitis media and pneumonia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The present sequence is the BASB031 polypeptide, from strain MC2969, derived from Moraxella catarrhalis. This sequence has homology to Pseudomonas aeruginosa, PilQ fimbrial assembly protein. This sequence can be used for prevention and treatment of M.catarrhalis infections, like otitis media, preumonia, sinustitis and nosocomial infections. The antibodies and polynucleotide sequence can be used for diagnosing infections, staging of disease and for determining the response of an infections organism to drugs. The DNA sequence is also used as a hybridisation probe in screening process for identifying homologue and orthologs from other species.
Novel polypeptides used as vaccines for treating Maraxella catarrhalis infections like otitis media and pneumonia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .

Bordetella pertussis possesses a type III secretion system. Type III secretion systems allow bacteria to target viruleance factors directly at host cells. The present sequence is the BscC protein of B. pertussis. The present protein is encoded by a Class I type gene and is involved in parteceptor system of B. pertussis i.e. a Bordetella pathogenicity protein. The gene of the present protein is located within a pathogenicity island (see AAA64890). A pathogenicity island is a compact, distinct generic unit carrying virulence genes. The present protein may be used to treat or diagnose B. pertussis infection, e.g. as a vaccine. Whooping cough is a disease caused by infection by B.
                                                                           Novel polypeptides derived from Bordetella pertussis, useful for treating and diagnosing Bordetella infection -
                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

These can be used to produce vaccines which protect against M. catarrhalis infection, which can cause otitis media, respiratory infection, sinusitus, and pneumonia. The present sequence is a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Moraxella polypeptide and polynucleotides useful as vaccine for immunizing a host e.g. humans against disease e.g. otitis media, pneumonia, caused by infection of the bacteria
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1.2%; Score 9; DB 23; Length 473;

This sequence is the XcpQ secretion factor of Pseudomonas alcaligenes. The DNA represents a nucleic acid of the invention. The nucleic acids encode: (a) a kinase from a Pseudomonad that regulates the expression of a lipses; (b) a DNA binding regulator from a Pseudomonad that regulates
                                                                                                         Kinase; LipQ; LipR; lipase expression regulator; DNA binding regulator; sigma 54 promoter; secretion factor; lux-box binding element; orfV-box binding element; regulation cascade.
                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acids encoding proteins involved in the lipase regulation cascade from P. alcaligenes - useful for controlling production and secretion of heterologous proteins in P. alcaligenes

(first entry)

can be used for producing heterologous proteins in host cells, particularly, lipase in Pseudomonas. Lipases produced can be used in detergents and cleaning formulations in industrial processes. These invention provides a higher production level and efficiently express a heterologous procein. The present sequence represents XcpO isolated from Pseudomonas alcaligenes, from the present invention.

the expression of a lipase; (c) a Pseudomonas alcaligenes upstream activating sequence; (d) a P. alcaligenes sigma 54 promoter that regulates the expression of a lipase; (e) a P. alcaligenes secretion factor selected from XcpP, Q, R, S T, U V, W, X, Y and Z, and OrfV, X, Y; (f) a P. alcaligenes lux-box binding element; and (g) a orfV-box binding element; and (g) a orfV-box binding element. The nucleic acids represent parts of a regulation cascade, comprising at its heart a kinase and a DNA binding regulation. These sequences can be used for the production of heterologous proteins in a host call. The cascade also comprises secretion factors which can enhance the secretion of produced proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Expression vector for producing heterologous proteins in host cells comprises a nucleic acid encoding a kinase and a DNA binding regulator which hybridizes under stringent conditions to nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pseudomonas alcaligenes; expression; lipase regulation cascade; kinase; DNA binding regulator; polymerase; promoter; secretion factor; XcpP; XcpQ; XcpP; XcpV; XcpV; XcpX; XcpX; XcpY; XcpV; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; OrfY; Orf

The secretion factor is encoded by an open reading frame identified in a cosmid (see AAF30870) derived from P. alcaligenes DNA. Secretion factors aid the secretion of other proteins from a cell. A new expression system comprises components of a lipase regulation cascade including a kinase, DNA binding regulator, polymerase, a promoter, an upstream activating sequence, and secretion factors. The secretion factor is preferably sequence, and secretion factors. The secretion factor is preferably concert with other members of the XCp family. Plasmids and concert with other members of the XCp family. Plasmids and transformed cells are provided, and also host cells which further comprise a nucleic acid encoding a desired protein, especially an esterase, hydrolase, lipase, isomerase, mutase, transferase, kinase or phosphatase (claimed). A hyper-producing strain can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel isolated nucleic acid encoding kinase from Pseudomonas that can regulate expression of lipase, useful in expression systems for production of lipase which is useful in detergents and cleaning formulations

```

The present invention describes an expression vector comprising a nucleic acid encoding a kinase and a DNA binding regulator which hybridises under stringent conditions to a nucleic acid isolated from pseudomonas alcaligenes. Also described are: (1) an isolated plasmid comprising the above expression vector; (2) a method of transforming a host cell comprising adding the above plasmid to host cells under appropriate conditions; (3) a transformed host cell comprising the above expression vector; and (4) a method for producing a protein comprising the steps of obtaining a host cell comprising the shove expression vector and further comprising nucleic acid encoding the protein, and culturing the host cell under conditions for the expression of protein. The expression vector of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a polynucleotide encoding a DNA binding regulator that can regulate the expression of a lipase. The invention also relates to an expression system comportising components of Pseudomonas alcalignes lipas regulation cascade which includes kinases, DNA binding regulators, polymerases, promoters, upstream activating factors and secretion factors. DNA binding regulators of the invention are useful for regulating the expression of a lipase, where the lipase is useful in detergents and other cleaning formulations as well as a number of industrial processes. Various methods and systems designed for the production of heterologous proteins. The present sequence is P. alcaligenes XCPO, a secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polynucleotide encoding DNA binding regulator, useful for regulating expression of lipase especially in pseudomonad, and lipase useful in detergents and other cleaning formulations and in various industrial

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the companies. Their use in the discovery of novel antibiotics, the essential companies their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella compendation is also useful for the identification of potential new targets invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an evential prokaryotic cellular proliferation protein.

Where the printed specification, but was obtained in electronic formit directly from MPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Domain
RESULT 18
                   AAW86007
                                                     The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) and sequences against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical insorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cannot be for generic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human cannot amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO can fire. The interpretation of the printed of the or appear in the printed can fee in ftp.wipo.int/pub/published_pct_sequences.

                       This polypeptide comprises an autophosphorylating histidine kinase encoded by the Candida glabrata CgSln1 gene (see AAV80320). CgSln1 pto volume to component response regulator that is involved in phenotypic switching, significant because of a direct correlation between phenotypic switching and the level of virulence of the organism. A claimed method for screening candidate pharmaceutical compounds involves contacting the test substance with yeast cells on the level of expression of the gene. The screening method is noted to identify compounds that effectively inhibit phenotypic switching, and thus pathogenicity, in C. glabrata for use as

ઠે

```
The present invention relates to Mycobacterium tuberculosis secreted proteins (MTSP), where the polypeptide has M. tuberculosis specific antigenic and immunogenic properties. Compositions of the invention may be useful for diagnosing Mycobacterium tuberculosis infection and as a vaccine against M. tuberculosis infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   22; Length 111;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) and can be used in gene therapy and vaccine production. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polyuncleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting the mucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to provent, diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic-derived cells. AAK64703 to AAK87694 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK64922 to AAK64995 and AAM82169 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

```
The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention.
                                                                                                                                                                                                                                                                                                                            New protein from Neisseria gonorrheae, useful for the manufacture of medicament for treating or preventing N. gonorrheae infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1.0%; Score 8; DB 24; Length 118;

Purine/pyrimidine triphosphate type nucleotidyltransferase #205. Nucleotidylyltransferase, enzyme; active site engineering; apha-D-glucopyranosyl phosphate thymidylyltransferase; Ep; substrate specificity; nucleotide sugar; glycosylated bioactive natural product. (first entry) Neisseria meningitidis.

Nucleotidylyltransferase mutated at one or more amino acids, useful in the synthesis of nucleotide sugars

The invention relates to a Nuclectidylyltransferase mutated at one or more amino acids selected from V173, G147, W224, N112, G175, D111, E162, T201, I200, E199, R195, L897, L109, Y146 or Y177 (with reference to T201, I200, E199, R195, L897, L109, Y146 or Y177 (with reference to the Salmonella enterica rmlA-encoded alpha-D-glucopyranosyl phosphate to the Salmonella enterica rmlA-encoded alpha-D-glucopyranosyl phosphate the Substrate specificity of the enzymes. The mutations altering uncleotidylyltransferase substrate specificity. The mutations are used in the synthesis of nucleotide sugars for altering nucleotidylyltransferase exhibits different substrate specificity for nucleotidylyltransferase exhibits different substrate specificity for TPP, CTP, TTP, UTP and ATP than a non-mutated nucleotidylyltransferase. The mutant can be exploited in the biosynthesis of glycosylated thymidylyltransferase (Ep) and can convert a wide variety of phosphates. The mutants can be exploited in the biosynthesis of glycosylated boactive natural products of pharmacological use. The present sequence is a nucleotidylyltransferase exhibiting a high degree of sequence identity to Salmonella enterica LT2 alpha-D-glucopyranosyl phosphate thymidylyltransferase (Ep). ô Gaps ö Length 231; 0; Indels Ouery Match 1.0%; Score 8; DB 23; Best Local Similarity 100.0%; Pred. the Salmonella enterica rmlA-encoded alpha-D-glucopyranosyl phosphate thymidylytransferase, Ep, enzyme appearing as ABG91799). The mutations alter the substrate specificity of the enzymes. The mutations and methods involving them are used in the synthesis of nucleotide sugars for altering nucleotidylytransferase exhibits different substrate specificity. The concleotidylytransferase exhibits different substrate specificity for altering nucleotidylytransferase exhibits a non-mutated nucleotidylytransferase. The mutant may also exhibit a high degree of sequence identity to salmonella enterica II2 alpha-D-glucopyranosyl phosphate from a non-mutated nucleotidylytransferase. The mutants can be exploited in the biosynthesis of glycosylated the mutants can be exploited in the biosynthesis of glycosylated chosphate is a nucleotidylytransferase exhibiting a high degree of sequence is a nucleotidylytransferase exhibiting a high degree of sequence identity to Salmonalla enterica II2 alpha-D-glucopyranosyl phosphate thymidylytransferase (Ep).

Sequence identity to Salmonalla enterica II2 alpha-D-glucopyranosyl phosphate thymidylytransferase (Ep).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New protein from Neisseria gonorrheae, useful for the manufacture of medicament for treating or preventing N. gonorrheae infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1.0%; Score 8; DB 23; Length 231; 100.0%; Pred. The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the growaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the sessential comparts and the encoded proteins. The prokaryotes used are probabled as a seruginos and Entercoccus faccilis. The convention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to invention is also used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery conto obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery contourned nucleic acid sequence is also useful to screen for homologous mucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

The present invention describes a method for detecting a stress that alters a functional interaction of a low density lipoprotein (LDL) receptor binding protein (I) with an LDL receptor interaction domain (II). The method involves introducing a predetermined stress into a system which provides a stress-biased physical interaction of (I) with absence of the stress. The system provides an interaction of (I) and (II), where a difference between BI and UI interaction of (I) and (II), where a difference between BI and UI is selected from SEMCAP-1, JIP-1, PSD-95, JIP-2, Talin, OMP25, CAPON, PIP-4, Stinse, Na channel brain 3, Mint1, ICAP-1 and APC subunit 10. The method is useful for detecting a stress that alters functional interaction of LDL receptor binding polypeptide with LDL receptor interaction domain. The method is useful for detecting and modulating represent LDL receptor binding proteins which are used in the represent LDL receptor binding proteins. ABB04778 to ABB04909 exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                           Low density lipoprotein receptor binding protein; signal transduction;
LDL receptor binding protein; LDL receptor signalling pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Detecting stress that alters interaction of LDL receptor binding polypeptide with LDL receptor interaction domain, comprises detecting difference in stress-biased and unbiased interaction of peptide and domain in a system -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1.0%; Score 8; DB 23; Length 1024;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAA65809 to AAA65889 and AAA66058 to AAA66138 represent nucleotide sequences derived from Escherichia coli which inhibit E. coli proliferation. AAA65890 to AAA66055 and AAB15886 to AAB16060 to Present nucleotide and protein sequences associated with E. coli proliferation. AAA66056 and AAA66057 represent primers used for sequencing E. coli proliferation inhibiting nucleotide inserts in an example from the present invention. Methods from the present invention can be used to identify a proliferation-required gene in a microorganism, by contacting a microorganism with a proliferation-required gene activity inhibitory nucleic acid identified in another organism, and determining if inhibition occurs in the second microorganism. The nucleic acid sequences identified as being required for bacterial growth and proliferation, can be used for antisense therapy for killing bacteria.
                                                                                                                                                                                                                                                                                                                                                                               Carr GJ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel polynucleotides and polypeptides associated with microorganism proliferation, used to identify inhibitors of bacterial growth and proliferation, for use in antisense therapy -

The present invention describes cadherin modulating agents (MA)

comprising peptides which comprise a nonclassical cadherin cell adhesion
recognition (CAR) sequence. The MAs can be used for editional conclassical cadherin-mediated functions. They can be used for e.g.
inhibiting adhesion of nonclassical-cadherin expressing cells in a mammal, enhancing delivery of a drug through the skin of a mammal, enhancing delivery of a drug to a tumour in a mammal, thibiting metastasis of a cancer in a mammal, inhibiting metastasis of a cancer in a mammal, inhibiting managenesis in a mammal, inducing apoptosis in a mammal, inhibiting properties in a mammal, enhancing delivery to the expressing cell, preventing or treating obseity in a mammal, simulating blood vessel regression in a mammal, enhancing adhesion of central nervous system, treating ademyelinating neurological disease, increasing vasopermeability in a mammal, enhancing adhesion of central nervous system, treating cells, inhibiting synaptic stability in a mammal. They can also be used for e.g. enhancing or directing neutric outgrowth, facilitating wound healing or reducing scar tissue, or enhancing edecation of foreign cells and ammal. They can also be used for the adming or reducing scar tissue, or enhancing enginesis, arthritis, age-related macular degeneration, multiple sclerosis and diabetes. The products can also be used for detection and diagnosis and confides, and AAX64573 to AAX64573 represent specifically cereating perferent invention.

sequences used in the exemplification of the present invention.
Modulation; nonclassical cadherin mediated cell adhesion; CAR; inhibition; cadherin extracellular domain; cell adhesion recognition; OB-cadherin-5; cadherin-6; cadherin-7; cadherin-18; cadherin-18; cadherin-18; Cadherin-18; Cadherin-18; T-cadherin; PB-cadherin; desmocallin; calcium binding; cancer; tumour; obesity; rheumatoid arthritis; multiple sclerosis; diabetes; metastasis; neurological disease; cyclic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "the terminal residues are condensed with each other to form a cyclic peptide"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New cadherin modulating agents, used for modulating nonclassical cadherin-mediated functions for treating e.g. cancers, obesity, rheumatoid arthritis, multiple sclerosis, diabetes or a neurological

Their role is to initiate the translocation of a protein from the site of synthesis, but they are excised during translocation. The peptides which are translocated by these signal peptides are a new group of proteins which can be used for the detection and control of tuberculosis. They correspond to the 85-C antigen containing region of Mycobacterium tuberculosis and can be used in the production of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; complementary peptide; ligand; drug discovery; drug design.

                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                              The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification.

The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug candidates or pro-drugs -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              G protein-coupled receptor (GPCR) antigenic peptide SEQ ID NO:1405

Continuous, isolated, antigenic polypeptide segment of herpes simplex virus (HSV) glycoprotein B1 or B2, useful in serodiagnostic immunoassays for distinguishing HSV-1 infection from HSV-2 in a human -
                                                                                                                   The present invention provides antigenic peptides from herpes simplex virus type 1 (HSV1) and 2 (HSV2) glycoprotein B (gB) which can be used the diagnosis of HSV infection, and identification of subtype, and in vaccines to protect against HSV. The present sequence is a fragment of the HSV-2 gB protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                              The sequences given in AAR26160-66 are peptides which were used in the scope of the invention to raise antibodies against tuberculosis. They correspond to regions of the 85-C antigen containing region of Mycobacterium tuberculosis and can be used in the production of vaccines for immunisation against tuberculosis. The peptides may be used to raise antisera and in this case would be synthesised with an additional cysteine residue, pref. attached to the amino terminal. This facilitates coupling of the peptide to a carrier molecule which is necessary to render the peptide immunogemic. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequences AAV58531-Y58572 represent antigenic peptides derived from
somatostatin receptor (SSR) subtypes of rat, mouse and human. The
invention relates to peptide antigens derived from a specific antigenic
region of a somatostatin receptor, to SSR subtype-specific antibodies
induced by the peptide antigens, and to immunological methods using the
SSR-subtype specific antibodies for determining the presence and
distribution of SSR subtype(s) in a tissue sample, and for the isolation
of unification of somatostatin receptor proteins. The antigenic region
of SSR is located in the C-terminis, which extends intracellularly from
transmembrane domain 7. The peptide antigens that are derived from this
region are capable of inducing high affinity, high specificity anti-
sequences that are expressed by the cells of tissue sample. The invention may be used for characterization of the SSR
cumour sample, via immunological methods such as immunoble, and
immunological methods such as immunoble, of subtype specific
commatostrochemical or immunoprecipitation analysis. Identification
of SSR subtypes is important in the development of subtype specific
somatostatin analogues and for their diagnostic and therapeutic use.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

Sequences AAYS8533-YS8872 represent antigenic peptides derived from
somatostatin receptor (SSR) subtypes of rat, mouse and human. The
interaction relates to peptide antigens derived from a specific antipodies
region of a somatostatin receptor, to SSR subtype-specific antibodies
induced by the peptide antigens, and to immunological methods using the
SSR-subtype specific antibodies for determining the presence and
distribution of SSR subtype (s) in a tissue sample, and for the isolation
and purification of somatostatin receptor proteins. The antigenic region
and purification of somatostatin receptor proteins. The antigenic region
cof SSR is located in the C-terminus, which extends intracellularly from
transmembrane domain 7. The peptide antigens that are derived from this
region are capable of inducing high affinity, high specificity anti-
contacted in antibodies which can distinguish between SSR subtypes. The
methods of the invention may be used for characterisation of the SSR
subtypes that are expressed by the cells of a tissue sample e.g., a
tumnory tochemical or immunoprecipitation analysis. Identification
of SSR subtypes is important in the development of subtype specific
somatostatin analogues and for their diagnostic and therapeutic use.
